9691/33
Paper 3 Written Paper
May/June 2016
MARK SCHEME
Maximum Mark: 90
Published

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge will not enter into discussions about these mark schemes.
Cambridge is publishing the mark schemes for the May/June 2016 series for most Cambridge IGCSE ${ }^{\circledR}$, Cambridge International A and AS Level components and some Cambridge O Level components.

1 (a) (i) BOoKING andName. PerformanceDate, Star Time, Ven ename)
(ii)

$2 \times$ correct relationships
(b) (i) Not in $2 N F \ldots$

BOOKING
NoOfMusicians is only dependant on knowing part of the PK (i.e. the BandName) there is a non-key attribute which is dependent on only one of the PK attributes // there are partial dependancies

BOOKING (BandName, PerformanceDate, StartTime,VenueName)
All correct .
(ii) Not in $3 N F \ldots$

Max [5]
BAND
Since there are dependent non-key attributes
ManagerName and ManagerPhoneNumber are both dependent on ManagerID
Re-design ...
BAND (BandName, NumberOfMusicians, Genre, ManagerID)
New table MANAGER ...

MANAGER (ManagerID, ManagerName, ManagerPhoneNumber)
(c) SELECT BandName, PerformanceDate

FROM BOOKING
WHERE VenueName = 'Dominion Theatre';
(d) UPDATE BOOKING

SET StartTime = '21:00'
WHERE BandName = 'RUS' AND PerformanceDate = \#06/08/2016\#

| With nothing after the ' 3 ' |  |  |  |  |  |  |

4 (a)
The program instructions are stored in a continuous block of main memory.
The Program Counter stores the address of the next instruction to be fetched.
Stage 1. The contents of the Program Counter are copied to the MAR.
Stage 2. The contents of the PC are then incremented.
Stage 3. The value in the Memory Address Register is loaded to the address bus. The data value found at this address is loaded on to the data bus and copied to the MDR.
Stage 4. The contents of the Memory Data Register are copied to the CIR and its contents processed to separate the (op code and the operand).
The instruction can now be executed.
Note: final two can be inter-changed and are 1 mark only.
(b) (i)

## Case 2

The address in CIR must be loaded to the MAR / address bus
The data value must be retrieved from this address / address 139

| 3 | 10 | 11 | 14 | 20 | 32 | 48 |

Mark as follows:
1 mark for correctly circled data items
Highlighted row $\times 2$ marks

6 (a) (i) Any five from:
Max [5]
Running - The process currently has use of the processor
Ready - the process is able to use the processor but the processor is currently allocated to another process

Suspended/Blocked - the job is unable to use the processor
When a process is suspended the processor will have a strategy/ by example
For deciding which process gets next use of the processor
Any example of a process changing states
A second example of a process changing states
The next process to get the processor is at the head of the Ready queue
(ii) Interrupt signal is used to trigger a change of state
for the process in the running state
(b) Any two from:

Maintain a file directory
Detail - file name, file size, date saved (2 or more items for the mark)
Manage the unallocated storage units // Use of a FAT
(c) Any one from:

The input/output of data // the peripherals
Provision of a user interface
Main memory management

[^0]:    (ii)

    Case 1
    The operand is a register // the register is part of the CPU // it is using only the Accumulator
    There is no memory access
