Paper 4 A Level Structured Questions

October/November 2017

2 hours

Candidates answer on the Question Paper.

Additional Materials: Data Booklet

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer all questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

A Data Booklet is provided.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

Answer **all** the questions in the spaces provided.

(b) The central atom in the molecule of ClO_2 is chlorine. Draw the 'dot-and-cross' diagram for ClO_2 . Show outer electrons only. (c) The reaction between ClO_2 and F_2 is shown. $2ClO_2 + F_2 \rightarrow 2ClO_2F$	 (a) Using oxidation numbers, explain why this reaction is a redox reaction. (b) The central atom in the molecule of ClO₂ is chlorine. Draw the 'dot-and-cross' diagram for ClO₂. Show outer electrons only. (c) The reaction between ClO₂ and F₂ is shown. 2ClO₂ + F₂ → 2ClO₂F The rate of the reaction was measured at various concentrations of the two reactants a following results were obtained. 	(a) Using oxidation numbers, explain why this reaction is a redox reaction.	The	e con	ipouria critorii	_	be prepared by the r		
(b) The central atom in the molecule of ClO_2 is chlorine. Draw the 'dot-and-cross' diagram for ClO_2 . Show outer electrons only. (c) The reaction between ClO_2 and F_2 is shown. $2ClO_2 + F_2 \rightarrow 2ClO_2F$ The rate of the reaction was measured at various concentrations of the two reactants a following results were obtained.	(b) The central atom in the molecule of ClO_2 is chlorine. Draw the 'dot-and-cross' diagram for ClO_2 . Show outer electrons only.	(c) The reaction between ClO_2 and F_2 is shown. $ 2ClO_2 + F_2 \rightarrow 2ClO_2F $ The rate of the reaction was measured at various concentrations of the two reactants at following results were obtained. $ ClO_2 + F_2 + $				$NaClO_2 + \frac{1}{2}C$	$Cl_2 \rightarrow ClO_2 + NaC$	l	
(b) The central atom in the molecule of ClO_2 is chlorine. Draw the 'dot-and-cross' diagram for ClO_2 . Show outer electrons only. (c) The reaction between ClO_2 and F_2 is shown. $2ClO_2 + F_2 \rightarrow 2ClO_2F$ The rate of the reaction was measured at various concentrations of the two reactants a following results were obtained. (i) What is meant by the term *order of reaction* with respect to a particular reagent?

	(ii)	Use the results of experiment 1 to calculate the rate constant, k , for this reaction. Include the units of k .
		rate constant, <i>k</i> = units [2]
(1	iii)	Use the data in the table to calculate
		• the initial rate in experiment 2, $initial \ rate = \ mol dm^{-3} s^{-1}$
		• $[ClO_2]$ in experiment 3. $[ClO_2] = \dots \mod dm^{-3}$
(d)	(i)	$[CtC_2] = \frac{1}{2}$ What is meant by the term <i>rate-determining step</i> ?
		[1]
	(ii)	The equation for the reaction between ClO_2 and F_2 is shown.
		$2ClO_2 + F_2 \rightarrow 2ClO_2F$
		$rate = k[ClO_2][F_2]$
		The mechanism for this reaction has two steps.
		Suggest equations for the two steps of this mechanism, stating which of the two steps is the rate-determining step.
		step 1
		step 2
		rate-determining step =[2]
(e)	Ву	considering the rate equation, explain why the rate increases with increasing temperature.
		[1]
		[Total: 13]

2	(a)		en water is added to magnesium nitride, ${\rm Mg_3N_2}$, the products are a white suspension of ${\rm (OH)_2}$ and an alkaline gas.
		(i)	Write an equation for this reaction.
		410	[1]
		(11)	A 2.52g sample of Mg ₃ N ₂ is added to an excess of water.
			Calculate the mass of Mg(OH) ₂ formed.
			mass of Mg(OH) ₂ = g [2]
	(b)	Sta	te and explain how the solubility of the Group 2 hydroxides varies down the group.
			[4]
	(c)		gnesium hydroxide is sparingly soluble in water. The concentration of its saturated solution $98\mathrm{K}$ is $1.7\times10^{-4}\mathrm{moldm^{-3}}$.
		(i)	Write an expression for the solubility product, $K_{\rm sp}$, of Mg(OH) $_{\rm 2}$.
			K_{sp} =
		(ii)	Calculate the value of $K_{\rm sp}$ for Mg(OH) $_{\rm 2}$ at 298 K and state its units.
			K_{sp} = units [2]

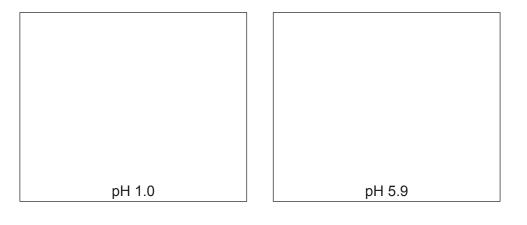

(d)	down the group.
	Suggest an explanation for this trend in the decomposition temperature of the Group 2 hydroxides.
	[2]
	[Total: 12

3 Serotonin can be synthesised from the amino acid tryptophan in two steps.

(a) (i) In a buffer solution at pH 5.9, a sample of tryptophan does **not** move during electrophoresis.

Draw the structures of the ions formed by tryptophan at pH 1.0 and pH 5.9.

(ii) Tryptophan can combine with valine to form a dipeptide.

Use the *Data Booklet* to draw the structure of this dipeptide.

[2]

[2]

(b) Complete the following table to show the structures of the products formed and the *type of reaction* occurring when **serotonin** reacts with the four reagents in separate reactions.

reagent	structure of product	type of reaction
Na		
excess Br ₂ (aq)		
excess CH ₃ COC <i>l</i>		
excess H ₂ /Pt catalyst		

(c) Serotonin is converted by enzymes in the liver to compound \mathbf{M} .

(i)	By reference to the <i>Data Booklet</i> , suggest how the infra-red spectrum of M would differ from that of serotonin.
	[1]
(ii)	The proton NMR spectrum of ${\bf M}$ dissolved in CDC l_3 shows eight peaks due to the eight different types of proton present in the molecule.
	The proton NMR spectrum of M dissolved in D ₂ O was recorded.
	Predict the number of peaks that would be seen in the proton NMR spectrum of $\bf M$ in $\rm D_2O$. Explain your answer.
	number of peaks
	explanation
	[2]

(d) Compound ${\bf M}$ can be polymerised under certain conditions to form polymer ${\bf N}$, shown.

Polymer N	vi V	biodegradable.	unlike	nolvethene	which	is no	١t
I CIVILICI I	1 13	Diouculadable.	uiiiiii			10 110	Jι

Explain why **N** is biodegradable.

[3]

5 (a) The arrangement of the anions around a cation is called the geometry of the cation; e.g. in $[CuCl_4]^{2-}$ the geometry of copper is tetrahedral and the co-ordination number of copper is 4.

The geometry of a cation in an ionic compound can be predicted from the ratio of the ionic radii of the cation and anion involved.

cation radius anion radius	geometry of cation
0.155-0.225	trigonal planar
0.225-0.414	tetrahedral
0.414-0.732	octahedral

Use data from the *Data Booklet* to predict the geometry of, and hence the co-ordination number of, the cation for

sodium	chloride,	NaC1
	sodium	sodium chloride,

geometry of Na⁺ = co-ordination number of Na⁺ =

• magnesium chloride, $MgCl_2$.

geometry of Mg^{2+} = co-ordination number of Mg^{2+} = [2]

(b) Magnesium(I) chloride, MgC*l*, is an unstable compound and readily decomposes as shown.

$$2MgCl(s) \rightarrow Mg(s) + MgCl_2(s)$$

Use the following data to calculate the enthalpy change of this reaction.

$$\Delta H_{\rm f}^{\rm e} \, {\rm MgC} \, l({\rm s}) = -106 \, {\rm kJ} \, {\rm mol}^{-1}$$

 $\Delta H_{\rm f}^{\rm e} \, {\rm MgC} \, l_{\it s}({\rm s}) = -642 \, {\rm kJ} \, {\rm mol}^{-1}$

enthalpy change =kJ mol⁻¹ [1]

(a) I'm addation for minor are latitude and gy for ingerio and	(c)	(i)	The equation for which ΔH is the lattice energy for MgC l is sh	าดพ	n
--	-----	-----	---	-----	---

$$Mg^+(g) + Cl^-(g) \rightarrow MgCl(s)$$

Use the equation, the following data, and relevant data from the *Data Booklet* to calculate a value for the lattice energy of MgC *l*. You might find it helpful to construct an energy cycle.

electron affinity of $Cl(g)$	= -349 k	J mol ⁻¹
enthalpy change of atomisation of Mg(s)	= +147 k	J mol ⁻¹
enthalpy change of formation of MgCl(s)	= -106 k	J mol ⁻¹

		lattice energy MgC l = kJ mol ⁻¹ [3]
	(ii)	Suggest how the lattice energies of ${\rm MgC} l_2$ and ${\rm NaC} l$ will compare to that of ${\rm MgC} l$. Explain your answers.
		$MgCl_2$ and $MgCl$
		NaCl and MgCl
		[3]
(d)	Def	fine the term <i>electron affinity</i> .
		[2]

6 (a)	Define the term transition r	netal compl	ex.						
						[1			
(b)	Platinum can form the com	Platinum can form the compound $[Pt(NH_3)_4Cl_2][PtCl_4]$.							
	State the co-ordination numbers and the oxidation numbers of the platinum in the two ions of this compound.								
		co-ordina	tion number	oxid	ation number				
	[Pt(NH ₃) ₄ Cl ₂] ²⁺								
	[PtCl ₄] ²⁻								
		1				[2			
						[2			
(d)	Solutions of the compound each other by a simple ch does not react in this test.								
	Complete the table with a test that could be used to positively identify each compound. Give details of expected observations with each compound.								
	test		observatior [Pt(NH ₃) ₄ C		observation with $[Pt(NH_3)_4Br_2]Cl_2$				

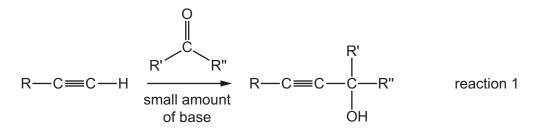

(e)	In this question you should consider geometrical and optical isomerism.
	What type of isomerism is shown by the following complexes? You should answer geometrical , optical , both or neither .
	octahedral [Co(NH ₂ CH ₂ CH ₂ NH ₂) ₂ Cl ₂] ⁺
	square planar [Ni(CN) ₂ Cl ₂] ²⁻
	tetrahedral [CuBr $_2$ C l_2] $^{2-}$
	[3
(f)	Many enzymes contain transition metal complexes.
	Describe, with the aid of a suitably labelled diagram, how an enzyme catalyses the breakdown of a substrate molecule.
	[3

[Total: 13]

7

(a)		cium carbide, CaC_2 , reacts readily with water, forming ethyne, C_2H_2 , and a sparingly solut te ionic compound.	ole
	(i)	Write an equation for the reaction of CaC ₂ with water.	
			[1]
	(ii)	Draw a 'dot-and-cross' diagram for the carbide ion, ${\rm C_2}^{2-}$. Show outer electrons only.	
			[1]
(b)	Eth	yne is the simplest member of the alkyne homologous series.	
		H—C≡C—H	
		ethyne	
	Pro	pyne, C_3H_4 , and butyne, C_4H_6 , are the next two members of the series.	
	Dec	duce the general formula for the alkynes.	
			[1]
(c)	Fth	yne can be polymerised into poly(acetylene), which is a conducting polymer.	
(0)			
		poly(acetylene)	
	(i)	Suggest why this polymer conducts electricity.	
	(ii)	State the empirical formula of poly(acetylene).	
			[1]
((iii)	By reference to a physical or chemical property, suggest one advantage of a conducti polymer when compared with metals.	ng
			[1]

(d) Alkynes can react with carbonyl compounds under basic conditions as shown in reaction 1.

(i) The first step of the mechanism of reaction 1 involves the alkyne anion reacting with the carbonyl compound.

Complete the first step of the mechanism and draw the intermediate for this reaction. Include all relevant dipoles, charges and curly arrows.

$$R - C = C - C - R''$$

$$R - C = C - C - R''$$
intermediate

(ii) Suggest the name of the mechanism in reaction 1.

.....[1]

(iii) An alkyne, **Q**, and a carbonyl compound, **R**, react together to form compound **P** as shown.

$$C_{2}H_{5}C = C - C$$

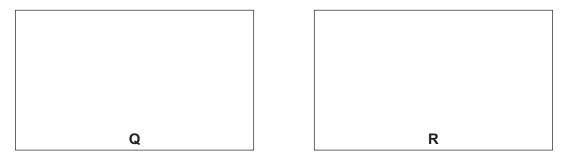

$$C_{1}CH_{3}$$

$$C_{2}H_{3}C = C - C$$

$$C_{2}H_{3}C = C - C$$

$$C_{3}CH_{3}C$$

Use reaction 1 to suggest the structures of **Q** and **R**.

(e) A series of twelve separate experiments is carried out as shown in the table.

Complete the table by writing in **each** box a tick (\checkmark) if a reaction occurs, or a cross (x) if no reaction occurs.

	CH₃CHO	HCO ₂ H	CH ₃ COCH ₃	HO ₂ CCO ₂ H
hot, acidified MnO ₄ -(aq)				
alkaline I ₂ (aq)				
warm Tollens' reagent

8 (a) Compound A can be produced from a plant hormone.

(i) Compound A shows optical and geometrical isomerism.

On the structure of **A** above,

- draw a **line** through the bond(s) that give rise to geometrical isomerism,
- circle all chiral carbon atoms.

(ii) Give the **names** of four functional groups present in **A**.

(iii) A molecule of **A** has 17 carbon atoms.

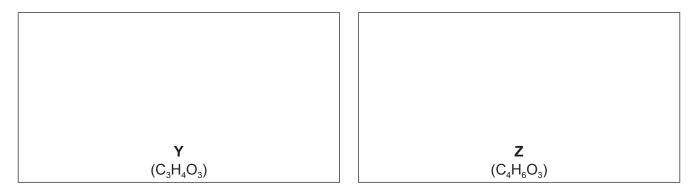

State the number of carbon atoms that are sp, sp² and sp³ hybridised in **A**.

sp carbons = sp^2 carbons = sp^3 carbons = [1]

(iv) When **A** is reacted with an excess of hot, concentrated manganate(VII) ions, a mixture of three organic compounds is formed.

$$\label{eq:A} \textbf{A} \quad \xrightarrow{} \textbf{X} \quad \text{and} \quad \textbf{Y} \quad \text{and} \quad \textbf{Z} \\ \quad (C_{10}H_{14}O_7) \quad (C_3H_4O_3) \quad \quad (C_4H_6O_3)$$

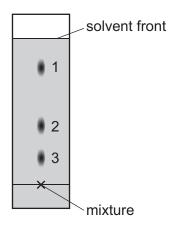

Suggest the structures of Y and Z.

[2]

(b) A mixture of three different compounds, **J**, **K** and **L**, was analysed by thin layer chromatography using a polar stationary phase and a non-polar mobile phase. The three compounds all have similar molecular masses. The resulting chromatogram is shown.

(i) Identify which spot corresponds to each compound.

compound	spot
J CH ₃ COCO ₂ H	
K HO ₂ CCO ₂ H	
L CH ₃ CH ₂ COCH ₂ CH ₃	

(ii)	Explain your answers to (b)(i).	
		[1]
(iii)	What is meant by the term R_f value?	
		[1]
